ABSTRACT

PURPOSE: To efficiently, exactly and easily operate plural sets of computer systems such as a large-sized host computer, a *network* controller, an exchange device, etc.

CONSTITUTION: A work station 10 and plural sets of computer systems 21, 22 and 2J are connected. In the work station 10, a *scenario* data base is provided, and in accordance with a *scenario* therein, a *scenario* in which a *command* to be given to the computer system, and a response from the computer system are registered in advance is displayed on a display device 14. When an operator looks at its display, and selects a desired *scenario* and pushes an execution button, a *command* corresponding to the selected *scenario* is read out of the data base, and sent out to the computer system concerned. When a response from the computer system is received, it is compared with a response of the data base, and a status for showing whether it is a normal end or generation of a fault is displayed on the display device 14.
